

**Amendments To The Claims**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

Claims 1-43 (Cancelled)

44. (New) A method for production of a vibration isolating pipe clip for securing a pipe to a support, the method comprising the steps of:

providing a rigid pipe clip body which is composed of one or more parts, which pipe clip body has an inner circumference and side edges, and which pipe clip body is provided with securing means for securing the pipe clip body to a support;

producing a vibration isolating member by forming and vulcanization of a rubber, wherein the vulcanized rubber is made porous by cleaving off water from a hydrated salt at a vulcanization temperature whereby closed cavities with separating walls between them are formatted in the rubber;

fitting the vibration isolating member against the inner circumference of the pipe clip body.

45. (New) The method according to claim 44, wherein the vibration isolating member is made from a material selected from the group of EPDM polymers.

46. (New) The method according to claim 44, wherein the vibration isolating member is formed by means of extrusion.

47. (New) The method according to claim 44, wherein the vibration isolating member is formed by means of injection moulding.

48. (New) The method according to claim 44, wherein vibration isolating strip material is extruded and rolled on a roll, and wherein an isolating member having an elongate strip-like body is cut from the roll, which strip-like body is fitted against the inner circumference of the pipe clip body.

49. (New) The method according to claim 48, wherein the porous strip-like body of the vibration isolating member is provided on its side edges with retaining edges, which retaining edges are fitted in a positively locking manner with the pipe clip body while the porous strip-like body is fitted against the inner circumference of the pipe clip body.

50. (New) The method according to claim 49, wherein, while fitting the porous strip-like body of the vibration isolating member against the inner circumference of

the pipe clip body, the retaining edges are positioned along the side edges of the pipe clip body.

51. (New) The method according to claim 49, wherein the retaining edges are formed with a less porous structure than the porous strip-like body of the vibration isolating member.

52. (New) The method according to claim 49, wherein the retaining edges are formed integrally on the porous strip-like body by means of a co-extrusion process.

53. (New) Vibration isolating pipe clip for securing a pipe to a support, in particular for securing a medium-carrying pipe to a wall or ceiling of a building, comprising:

- a rigid pipe clip body which is composed of one or more parts and is provided with securing means for securing the pipe clip body to a support,

- a vibration isolating member which bears against the inner circumference of the pipe clip body and is ultimately positioned between the outer circumference of the pipe and the pipe clip body,

wherein the vibration isolating member is made from porous vulcanized rubber with closed cavities and separating walls between them,

wherein the cavities are substantially unpressurized, in such a manner that in the event of a reduction in the volume of the cavities under the influence of deformation of the vibration isolating member, no significant pressure increase occurs inside the cavities,

wherein the vibration isolating member has a form factor defined by the quotient of the surface area which is subject to load and the free surface area, and in which the cavities significantly reduce the form factor, and

wherein the form factor of the vibration isolating member is less than 0.2.
